

UI/UX Specification

A focused workspace designed for founders who need clarity, momentum, and trustworthy AI assistance without a dense operational learning curve.

Version 1.0 | Made by DEX

Prepared from the Project VISTA source brief

UI / UX

A coherent operating blueprint for an intelligent startup workspace.

1. Experience Principle

VentureNest should feel like a calm working environment, not a prompt playground. Each view tells the founder what exists, what is uncertain, and what the next useful decision is. AI is visible as a collaborator with drafts and provenance, never as an opaque autopilot.

2. Information Architecture

The project is the primary working context. Major functions are grouped around a founder's natural sequence: discover, plan, build, execute.

3. Primary Screens

Screen	User intent	Key modules
Project home	Understand project health and choose next action.	Readiness score, recent artifacts, approvals, priorities, task snapshot.
Guided intake	Provide the context needed for useful output.	Step progress, examples, optional advanced assumptions, save-and-return.
Artifact studio	Generate, edit, review, and approve a business artifact.	Section outline, editor, source/assumption drawer, version history, approval control.
Research workspace	Inspect evidence and turn it into decisions.	Research question, findings, sources, confidence label, SWOT, save-to-plan.
Financial planner	Explore economics and runway with transparent inputs.	Assumptions panel, scenario tabs, forecast table/chart, sensitivity warnings.
Execution board	Convert strategy into owned work.	List/board view, filters, due dates, ownership, priority, linked artifact.

4. Critical Interaction Patterns

Pattern	Specification
Generate	Show the prompt intent and input summary before generation. A running job remains visible and recoverable if the user navigates away.

Pattern	Specification
Review and approve	Draft, in review, approved, and archived states are prominent. Approval requires an explicit action and records the version.
Assumptions	Use inline editable fields with a source or rationale. Changes display impacted artifacts and forecast values.
Source trust	Show publisher, URL, retrieval date, claim excerpt, and a verified/unverified/disputed badge.
Errors	Use plain-language recovery states: retry, edit inputs, view details, or contact support. Never discard user text.
Export	Let users select artifact version and PDF/structured export format; show an export job status for large files.

5. Design System

Token	Direction	Use
Colour	Ink/navy for hierarchy, teal for action, restrained gold for attention, neutral surfaces.	Accessible contrast; status is never colour-only.
Type	One readable sans-serif family; 16 px base body on desktop; compact headings in workspace views.	Scanable reading and data entry.
Layout	Left navigation, project context bar, 12-column desktop grid, single-column mobile flow.	Keeps tasks and artifacts visually stable.
Components	Buttons, segmented controls, tabs, data tables, drawers, status chips, empty states, command search.	Reusable, keyboard-operable patterns.
Motion	Short functional transitions for state change and job progress; reduce-motion preference respected.	No decorative motion competing with work.

6. Responsive and Accessible Behaviour

- Mobile prioritises project status, task completion, review, and quick edits; complex tables collapse into labelled rows.
- All workflows are keyboard navigable, with logical focus order, focus-visible styling, and skip links.
- Form validation names the field, explains the issue, and preserves entered values.
- Charts provide a tabular alternative; status, confidence, and priority have both icons/text and colour.
- Target WCAG 2.2 AA, including minimum contrast, meaningful labels, and touch targets of at least 44 by 44 px.

7. Content Style

- Write in direct, optimistic, non-sales language: 'Review the forecast assumptions' rather than 'Unlock your potential.'
- Use specific action labels: Generate draft, Request review, Approve version, Add source, Create task.
- Treat uncertainty honestly: 'Estimate', 'unverified source', and 'assumption' are useful product states.
- Use concise empty states that lead to a task: 'No research saved yet. Start with a customer problem question.'

8. UX Success Measures

Measure	Signal
Time to first approved artifact	Onboarding and generation are comprehensible.
Draft-to-approval rate	Output quality and review controls feel useful.
Assumption edit frequency	Founders are actively modelling rather than passively accepting output.
Task completion after plan approval	The product turns planning into execution.
Accessibility defect count	The shared component system remains usable for all users.
